• **Introduction**

o Aim

   Implement "The Menace" by replacing matchboxes with values in a hash table(the key will be the state of the game)

Train the Menace by running games played against the "human" strategy based on optimal strategy.

One will need to choose values for:
•alpha(the number of "beads" in each "matchbox" at the start of the game—maybe different for each move: first move, second move, etc.)
•beta(the number of "beads" to add to the "matchbox" in the event of a win)
•gamma(the number of "beads" to take to the "matchbox" in the event of a loss)
•delta(the number of "beads" to add to the "matchbox" in the event of a draw)

o Approach

- We created the dictionary for setting up the beads initially with nine keys with a value of 8 each. The current state list and board states' dictionary have also been created to keep the track of states generated.
- The random method is used to choose the random probability(r) and then compare it by adding the probability(p) for each box which is 1/9 or 0.11111111. We keep summing up the number until r < p. Then, that index is chosen, and the value at that key of the current state dictionary is replaced by 1.
- Now, the process repeats until the winning or draw state is obtained.
- Each time the menace wins, it is rewarded with 3 beads, if loses then we remove 1 bead and if the game is drawn then 1 bead is added to the state. By this, we are maximizing the chance of Menace to win the game.
- We are using tuple to make the state immutable
- After the training is done, the data is stored in the "training. pickle" file

- This file is used by menace to make smart moves while playing against a human player.

• **Program**

o Data Structures & Classes:

We have used List and Dictionary as Data structures for this project.

o Algorithm – Minimax algorithm is used to achieve the trained menace

o Invariants – Winning game positions are constant.

•**Flow Charts (inc. UI Flow)**

Pool

Lane 1

- Main Function
- Player vs Menance
- While
- Quit Game? — Yes → End Game
- No

Lane 2

- Start Game
- Menance Training? — No / Yes
- While
- New Game? — Yes / No
- For Loop

Lane 3

- Menance vs Menance
- For loop
- Last Iteration=? — Yes → End Game / No
- While
- Wining/Draw? — Yes / No
- Event = mouse clicked — No / Yes
- Wining/Draw? — No / yes
- Beads Number
  +3 for wining
  -1 for losing
  +1 draw

• **Observations & Graphical Analysis –**

The number of beads is changing linearly with number of games.
•Results & Mathematical Analysis

• **Conclusion**

The more the MENACE is trained, the better decision it takes to win the game.

First, we tried 500 games, which wasn't sufficient to train the MENACE as it was losing the game when played against Human players. We kept increasing the number of games from 500 to1000 to 10000 to 100000 and finally concluded that our MENACE was well trained with less probability of losing games when introduced for 100000 games or more.
